Group 1

Lab 06 Regression and Classification Models

ITAI-1371

Viswanatha Rao

Team Member Contribution Journal

Viktoriya Kurmisheva:

Completed Step 4 of Task 1 in Part 2, which focused on evaluating the Linear Regression model using Mean Squared Error to measure the difference between predicted and actual passenger fares. Also completed Steps 2, 3, and 4 of Task 2 in Part 3, which involved training the Logistic Regression model, making predictions on passenger survival, and evaluating its performance using accuracy_score. Answered Question 3 in the Knowledge Check section by explaining why regression and classification models require different evaluation metrics. After completing the lab, wrote the group's reflection journal based on the completed activities, group thoughts, results, and concepts covered in the notebook, then uploaded the completed reflection journal to the group's GitHub repository.

Tien Manh Nguyen:

Completed Step 1 of Task 1 in Part 2, which involved creating the Linear Regression model instance for predicting passenger fares. Also completed Step 1 of Task 2 in Part 3 by creating the Logistic Regression model instance for predicting passenger survival. Answered Question 1 in the Knowledge Check section by explaining the difference between regression and classification problems. Adjusted the notebook's Markdown formatting to make the instructions, headings, and answers easier to read while keeping the original lab content unchanged. After the group completed the assigned tasks, reviewed the notebook to make sure the code, results, and answers were correct and consistent with the lab requirements. Then uploaded the completed Jupyter Notebook to the group's GitHub repository.

Zaid Alayedy:

Completed Steps 2 and 3 of Task 1 in Part 2, which focused on training the Linear Regression model using the Titanic training data and making predictions on the test data. Also answered Question 2 in the Knowledge Check section by explaining what the model's coefficients represent and how they influence the predicted passenger fares. Examined how the Age and Pclass features contribute to the model's predictions and described the meaning of positive and negative coefficients. In addition, gathered the contribution information from each group member and used it to write and organize the Team Member Contribution Journal. Reviewed the contribution details to make sure the journal accurately described everyone's responsibilities.
